Abstract. Antiepileptic drugs (AEDs) are used extensively to treat multiple non-epilepsy disorders, both in neurology and psychiatry. This article provides a review of the clinical efficacy of AEDs in non-epilepsy disorders based on recently published preclinical and clinical studies, and attempts to relate this efficacy to the mechanism of action of AEDs and pathophysiological processes associated with the disorders.

Forensics/Chain of Custody. Antiepileptic drugs (AEDs) used to treat seizure disorders are today among the most common medications for which clinical laboratories perform therapeutic drug monitoring (TDM) (1, 2). The first-generation of AEDs—carbamazepine, ethosuximide, phenobarbital, phenytoin, primidone, and valproic acid—were introduced by U.S. and European drug manufacturers several decades ago, and TDM quickly became part of using them in clinical practice.

the human brain, thereby effecting either cure or substantial reduction of seizures in an individual with an otherwise intractable condition. Its use as a treatment modality dates from the late 19th century, and it has become a widely used treatment option throughout the world in the last 20-30 years. The complexity of epilepsy cases in surgical centres, and the need for invasive electrode studies for pre-surgical evaluation, are both greatly increasing. Invasive Studies of the Human Epileptic Brain is the definitive reference text on the use of invasive electroencephalographic (EEG) diagnostic studies in human epilepsy. Written by some of the most renowned epilepsy experts of the 20th and 21st centuries, the authors provide their expertise and

Vertigo, dizziness, and imbalance rank amongst the most common presenting symptoms in neurology, ENT, geriatric medicine, and general practice. These symptoms can originate from many different organs and systems, such as the inner ear, general medical conditions, neurological and psychological disorders.

The Oxford Textbook of Vertigo and Imbalance provides an up-to-date summary of the scientific basis, clinical diagnosis, and management of disorders leading to dizziness and poor balance. This textbook is conceptually divided into three sections, detailing the scientific basis, general clinical issues, and specific diseases diagnosed in clinical practice that are responsible for complaints of dizziness and imbalance.

Individual chapters address benign paroxysmal positional vertigo, vestibular migraine, vestibular neuritis, stroke, and Ménière's disease. Additional chapters follow a syndrome-based approach and cover multiple conditions, including cerebellar disorders, bilateral vestibular failure and gait, and psychological disorders. The print edition is complemented by an online version, which allows access to the full content of the textbook, contains links from the references to primary research journal articles, allows full text searches, and provides access to figures and tables that can be downloaded to PowerPoint. It serves a useful clinical reference for neurologists, otorhinolaryngologists, audio-vestibular physicians, and

Movement Disorders are a group of neurological conditions that cause problems with movement - either unwanted movements, or slowness and poverty of movement. Parkinson's disease is the most common of these conditions, and affects approximately 1% of the population. The treatment is complex, but does work, and there have been many recent exciting developments in the field. This book aims to help neurologists and other doctors in the recognition and treatment of these important medical problems by using the popular concise format of the Oxford Handbook, text that is easy to understand, and a DVD with videos

Instant Neurological Diagnosis: A Companion to NeurobowICO brings rapid neurologic diagnosis blended into a unique format that combines teaching and entertainment. Like the annual NeurobowICO competition, this book teaches neurologists to guess the answers of a diagnosis as fast as possible. This book tells users how to make a rapid clinical diagnosis or when to stop and reconsider previous diagnoses. The authors of this book have collected diagnostic short cuts; some from observations and others identified at grand rounds at NeurobowICO competitions at the American Academy of Neurology conference.

These diagnostic shortcuts include Handles - clinical features like facial appearance, how a patient dresses, walks, talks, the patients' history, and physical examination - that might permit a rapid diagnosis. Red Flags are the opposite. They are observations from the history and examination should alert the clinician to reconsider and think of an alternative diagnosis. Key Features Include

1. This text is highly visual; supplemented by figures, tables, and video clips.
2. Teaches neurologists to make a rapid diagnosis, even for rare diseases.
3. Shares tips for better patient management.

This book provides a comprehensive, rigorous review of the long-term outcome literature in epilepsy surgery in both adults and children. Each chapter examines the long-term outcome literature in a separate domain; covering seizure control, social, vocational/educational and psychiatric outcomes. Behavior and cognition are also discussed. The clinical predictors of good and bad outcomes in each domain are described and the gaps in

current knowledge are highlighted. Separate chapters examine the methodological challenges associated with long-term outcome studies and the special considerations associated with informed consent in this population. Long-Term Outcomes of Epilepsy Surgery in Adults and Children is essential reading for all members of multidisciplinary epilepsy surgery teams, including neurosurgeons, neurologists and neuropsychologists; it will enable these teams to counsel patients and parents who are considering epilepsy surgery as a therapeutic option.
