The POCKETBOOK OF CARDIOLOGY is designed to provide the practical information required for managing cardiology in-patients and out-patients. This includes sections on dealing with common out-patient consultations, common interspecialty referrals, cardiological problems on the cardiac surgery unit, acute cardiological emergencies, and terminal care in cardiology. Also, as cardiology is a specialty with a high technical content, sections are included that provide the core information relating to the common technical subspecialties - echocardiography, cardiac catheterisation and catheter intervention, pacing and electrophysiology. Finally, a technical data section provides details of normal values for cardiac catheterisation, echocardiography and electrocardiography. A practical manual of clinical cardiology, fully updated with the latest treatments and approaches. Attractive two colour layout. Written for doctors entering cardiology as career registrars who require practically-based materials, but of value to nursing staff and GPs. This revised edition has been fully updated with particular reference to the latest advances in cardiac catheterisation, and new changes in the therapeutic treatment of arrhythmias, IHD and ACS.

This book provides a clear and readable introduction to the central concepts of clinical neuroscience. The first part of the book deals with fundamental areas of neuroscience required for a sound understanding of brain disease. This is followed by an account of the neurobiology of the most common and important brain diseases of the western world (stroke, epilepsy, Alzheimer's disease, Parkinson's disease and multiple sclerosis). The book is in the same general style as the successful Crossman: Neuroanatomy with extensive colour illustrations.

An introductory textbook of neurology in the Illustrated Colour Text series, making full use of all the usual features of the series - double page spreads, short paragraphs, summary boxes, attractive use of colour etc. Clear explanation of neurological examination - often found very taxing by students. Demonstrates how to approach common neurological presentations, such as blackouts and numbness, before moving on to a comprehensive coverage of syndromes and diseases. Concentrates on the core curriculum which the medical student really needs to know. Updated management in the light of new evidence and new drugs most notably in Parkinson's disease, epilepsy and multiple sclerosis. Images, particularly MRI scans, updated with more modern and higher resolution images. Includes a new double-page spread on Sleep. Extra material added on giddiness to include the head thrust test and Epley's manoeuvre.

EMBRYOLOGY provides a concise and highly illustrated text, which confines its descriptions to those that are relevant for modern undergraduate and postgraduate medical courses, and similar courses in other related disciplines. An appreciation of embryology is essential to understand topological relationships in gross anatomy and to explain many congenital anomalies. Each chapter is supplemented by clinical point 'boxes' and by key revision points. Text in concise Illustrated Colour Text style, so core information on embryology can be quickly recognised and digested. Clear full colour diagrams and pictures make the embryological concepts clear and easily assimilated. Clinical boxes highlight essential points of importance to medical students.
